# ALGORITMA BRUTE FORCE

Metode penyelesaian dengan algoritma *Brute Force* adalah dengan mengecek tiap-tiap kemungkinan yang ada, hingga tercapai suatu hasil yang diinginkan. Pada tugas kecil kali ini, program ditugaskan untuk mengecek tiap operasi yang memungkinkan dari empat input angka dengan operasi +, -, \*, /, (, dan ). Tiap kemungkinan akan dihitung satu per satu, dan jika hasilnya berupa 24, bentuk operasinya akan di *print* ke layar.

Pada program sendiri ada dua pilihan masukan, antara *random* (pilihan kartu diacak oleh program) atau pengguna dapat memasukkan angka/huruf yang diinginkan, dengan pilihannya adalah: A, 2, 3, 4, 5, 6, 7, 8, 9, 10, J, Q, dan K.

Untuk contoh saja, misalkan pengguna melakukan masukan empat kartu yaitu 3, 5, 7, dan 8, maka program akan menghitung tiap kemungkinan operasi dari angka 3, 5, 7, dan 8. Salah satu kemungkinan operasi yang dapat menghasilkan 24 adalah  $3-((5-8)*7)$  dengan urutan operasi sebagai berikut:

- $3-((5-8)*7)$
- $3-(-3*7)$
- $3-(-21)$
- 24

Terbukti bahwa operasi diatas dapat menghasilkan 24. Sehingga, program akan meng-*print* operasi  $3-((5-8)*7)$  pada hasil akhir program.

Pada program yang telah saya buat, ditemukan adanya 42 kombinasi yang memungkinkan dari angka 3, 5, 7, dan 8 yang menghasilkan nilai 24. Sehingga, terdapat total 42 operasi yang harus di-*print* pada akhiran program.

## SOURCE CODE

Saya menggunakan bahasa pemrograman Java untuk tugas kecil ini. *Source code* dari program yang telah saya buat adalah sebagai berikut:

### File: brute.java

#### Class card

Mengubah nilai string kartu ke integer (A jadi 1, 2-10 sama aja, J jadi 11, Q jadi 12, dan K jadi 13).

```
class card {  
    public static int convertCardToInt(String rank) {  
        switch(rank){  
            case "A":  
                return 1;  
            case "2":  
                return 2;  
            case "3":  
                return 3;  
            case "4":  
                return 4;  
            case "5":  
                return 5;  
            case "6":  
                return 6;  
            case "7":  
                return 7;  
            case "8":  
                return 8;  
            case "9":  
                return 9;  
            case "10":  
                return 10;  
            case "J":  
                return 11;  
            case "Q":  
                return 12;  
            case "K":  
                return 13;  
            default:  
                return 0;  
        }  
    }  
}
```

#### Class DuaPuluhEmpat

Mengecek properti/nilai tiap kartu, dan mencari solusinya.

```

42 class DuaPuluhEmpat {
43     private static final List<IntBinaryOperator> operators = new ArrayList<IntBinaryOperator>();
44     private static final List<Character> opnames = new ArrayList<Character>();
45
46     public DuaPuluhEmpat() {
47         operators.add((a, b) -> a + b);
48         operators.add((a, b) -> a - b);
49         operators.add((a, b) -> a * b);
50         operators.add((a, b) -> (b != 0 && a % b == 0) ? a / b : Integer.MIN_VALUE);
51         operators.add((a, b) -> (a == 0 || a == 1 || b < 0) ? (int) Math.pow(a, b) : Integer.MIN_VALUE);
52         opnames.add(e: '+');
53         opnames.add(e: '-');
54         opnames.add(e: '*');
55         opnames.add(e: '/');
56     }
57
58     public List<String> solusi(String[] num) {
59         List<Integer> digits = new ArrayList<Integer>();
60         digits.add(card.convertCardToInt(num[0]));
61         digits.add(card.convertCardToInt(num[1]));
62         digits.add(card.convertCardToInt(num[2]));
63         digits.add(card.convertCardToInt(num[3]));
64         ArrayList<String> solutions = new ArrayList<String>();
65         for (int a = 0; a < 4; a++) {
66             for (int b = 0; b < 4; b++) {
67                 for (int c = 0; c < 4; c++) {
68                     for (int d = 0; d < 4; d++) {
69                         if ((a == b) || (a == c) || (a == d) || (b == c) || (b == d) || (c == d)) {
70                             continue;
71                         }

```

```

72                 for (int i = 0; i < 4; i++) {

## CHECKLIST

Poin	Ya	Tidak
1. Program berhasil dikompilasi tanpa kesalahan		
2. Program berhasil <i>running</i>		
3. Program dapat membaca input/generate sendiri dan memberikan luaran		
4. Solusi yang diberikan program memenuhi (berhasil mencapai 24)		
5. Program dapat menyimpan solusi dalam file teks
